

Aluminium "I" profile

Aluminium rail designed to carry low-weight studio equipment

Reference: 8013

EAN13: -

This aluminum rail model is designed to carry low-weight studio equipment. It is used for making grids in TV studios with lower height and is used for carrying cyclorama canvas. This profile is characterized by low weight (1.4 kg / m), good carrying capacity as well as easy and fast mounting of the rail with cyclorama cloth. The profile can be delivered in the length of 6m, and there are couplings for joining two or more profiles. This profile can also be delivered in a radius (curved with cyclorama cloth). The carriers of these rails are specially constructed for the geometry of this profile. At the ends of the mounted rails, the stops (blockers) are installed that ensure that the trolley can not come off the rails. In the production program of Elektrovat there are carts for carrying cyclorama canvas (carrying and tensile).
